Hi Rebecca -

My apologies for the delay in responding to your July 20th email. I was on vacation in California when it came in, and have just returned home this weekend.

Thank you for forwarding John Sweet's letter to me. It will serve our purpose, despite Sweet's false assertion that

"The WW2100 project resulted in the development of a number of software works, *which OSU has since bundled into a GitHub distribution under the CW3M name.*"

The false part of that sentence is the part that I italicized. Our CW3M committee, not OSU, has done the work of creating the community version of the Willamette River basin model, including moving the code and data to GitHub and choosing the "Community Willamette Whole Watershed Model" name. Moreover, CW3M now includes bug fixes, features, and whole submodels which are not present in any of the OSU projects which use the WRB model. For example, the stream temperature submodel was added to CW3M for the Lane Council of Governments, and a wetlands model is under construction now for LCOG as well.

CW3M is currently password-protected in GitHub, although I have given read-access to everyone who has asked for it. Now that OSU has finally provided their letter, we should go ahead and make the CW3M repository publicly readable without a password. Have you gotten a unanimous response from all the committee members for doing so, or should I wait until the next committee meeting to introduce a resolution for doing so one more time?

Best regards,

--Dave

Hi Rebecca,

Just following up on your request for a confirmatory letter from OSU regarding the distribution of the CW3M Software. Please see the letter attached here.

Thanks again for your attention to this. Let me know if you have any questions!

Best,
John
